

WHINT® MessageMissing Alert

This solution runs pro-actively as a job on your system (e.g. every hour during business hours or every month on the first) and checks in the message (performance) monitor if an interface ran or not. In case no message was found, an e-mail will be sent to a receiver.

Functionality

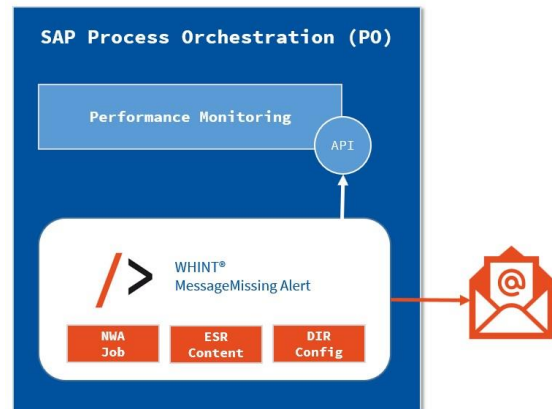

The tool is using the Standard API (performance monitoring servlet) of SAP PO and runs on your PO system as Integration Content (ESR Content and Directory configuration).

The standard alerting of SAP PI/PO or SAP Solution Manager does not solve the problem that an interface is expected to run during a specific period and simply might not arrive.

Alerts can usually only be raised when an error situation occurs (e.g. mapping or channel errors). Important messages might be missing and unnoticed during production hours.

Prerequisites

- > SAP Process Orchestration 7.3 EHP 1 and higher releases
